1. Introduction

1.1. Purpose of Study

This report provides the Federal Aviation Administration (FAA) with information on air safety and aviation infrastructure in southeast Alaska as of December 31, 2002. The data will establish a baseline to enable the University of Alaska Anchorage (UAA) to conduct an independent evaluation of how the Capstone program affects aviation safety in the region. The FAA contracted with UAA’s Institute of Social and Economic Research and Aviation Technology Division to do a variety of training and evaluation tasks related to the Capstone program. The program is a joint effort of industry and the FAA to improve aviation safety and efficiency in select regions of Alaska, through government-furnished avionics equipment and improvements in ground infrastructure.

The first phase of the program began in southwest Alaska in 1999. Phase II, in southeast Alaska, began in March 2003. The name “Capstone” is derived from the way the program draws together concepts and recommendations in reports from the RTCA (formerly Radio Telecommunications Conference of America), the National Transportation Safety Board, the Mitre Corporation’s Center for Advanced Aviation System Development, and representatives of the Alaskan aviation industry.

The Capstone program in southeast Alaska will install global positioning system (GPS)/wide area augmentation system (WAAS) avionics and data link communications suites in certain commercial aircraft; deploy a ground infrastructure for weather observation, surveillance, and Flight Information Services (FIS); and increase the number of airports served by instrument approaches. It will also create a usable instrument flight rules (IFR) infrastructure by reducing the minimum enroute altitudes on most airways and adding special low altitude routes and approaches. The FAA expects these improvements will reduce the number of mid-air collisions, controlled-flight-into-terrain (CFIT) incidents, and weather-related accidents in southeast Alaska.

The program focuses on air carriers conducting passenger and cargo operations under parts 133 and 135 of Federal Aviation Regulations (FAR; 14 CFR, Chapter 1). Part 135 operators typically fly air taxi, commuter, and flightseeing operations; part 133 operators use helicopters for various non-passenger activities such as helicopter logging. Aircraft owned by these carriers will be eligible to receive Capstone avionics in southeast Alaska. A large share of FAR part 135 operations in southeast Alaska are by float planes flying under Visual Flight Rules (VFR) in the summer season.

To form a complete picture of aviation safety in southeast Alaska, this study includes information on the aviation safety record not only of Capstone-eligible aircraft, but also general aviation aircraft, military planes, and private carriers regulated under other FAR parts. We present data on safety incidents dating back 10 or more years, but we emphasize the safety record from 1997 through 2002. Two challenges confront our safety analysis.

First, a significant regulatory change during this period confounds attempts to interpret aviation statistics. Second, data on air traffic in Alaska are limited and problematic. We briefly explain each of these issues. In early 1997, the FAA dramatically increased the scope of commercial aviation regulated under the more restrictive FAR part 121. Since March 20, 1997, all scheduled service using turbojet aircraft or aircraft with 10 or more passenger seats has fallen under part 121. The effect of this regulatory change on flight operations is not known. However, it is likely that many companies providing passenger service adjusted their fleets to avoid the cost of recertification under part 121. In addition, some service conducted under part 135 prior to 1997 is probably now under part 121, as the FAA presumably intended. This change makes it difficult to compare earlier data on incidents or operations to more recent data.

Second, the available data on flight operations is not highly accurate. The only source of publicly available data on air traffic that can provide regional and local information is the FAA’s Terminal Area
Forecast (TAF)\(^1\) system. That system uses data from airport operations to project future aviation system demands. The terminal operations data is of questionable reliability for airports without control towers to monitor traffic. In southeast, that includes all communities except Juneau. Consequently, accident and incident rates based on these data should be used with caution.

1.2. Description of the Capstone Southeast Alaska Region

The Capstone Southeast Alaska region (Capstone SE Alaska region) as defined in this study is all the area of Alaska south of north latitude 61 degrees and east of west longitude 146 degrees. This area includes Alaska’s panhandle and extends westward from the north end of the panhandle along the Gulf of Alaska to Cordova, on the western edge of Prince William Sound. The area is remote, with only a few roads between villages and no road connection to the state’s metropolitan centers. Residents rely on water travel in the summer and air travel year round. The 45 communities in the area have more than 75,000 residents, with almost half living in the regional hub of Juneau, which is also the state capital. Of the 44 other communities, 29 have fewer than 500 residents. The map below shows the major communities; Appendix B lists them all.

---

\(^1\) The Terminal Area Forecast System (http://www.apo.data.faa.gov/faatafall.HTM), created by the FAA’s Office of Aviation Policy and Plans, is the official forecast of aviation activity at FAA facilities. The forecasts are prepared to meet the budget and planning needs of the constituent units of the FAA and to provide information that can be used by state and local authorities, the aviation industry, and the public.
1.3. Air Operations in the Capstone Southeast Alaska Region

The Capstone SE Southeast Alaska region has 84 airport facilities—24 airports, 8 heliports, and 52 seaplane bases. Table 1-1 shows the 2002 traffic estimates (including commercial, private, and military) from the FAA’s Office of Aviation Policy and Plans. Commercial air traffic operations (take-offs and landings) in the region totaled about 240,000 in 2002—nearly 20 percent of commercial air traffic operations statewide.

Table 1-1 also shows total general aviation traffic operations totaling 163,580, or about 12 percent of general aviation operations statewide. Keep in mind that the airport terminal observations do not include landings and take-offs at locations away from established airports and therefore underestimate total aviation traffic in the region—especially itinerant general aviation originating in urban areas such as Anchorage and Juneau. Again, these numbers and any safety incident rates estimated from them should be interpreted with care.

1.4. Review of Recent Studies

Seven recent studies are of particular interest and relevance to the Capstone project:

Geographic Area. All seven studies of these cover a portion of Alaska or the state as a whole. They are relevant because the problems they describe are problems in southeast Alaska as well. Their characterization of commuter and air taxi operations in Alaska is also applicable to southeast Alaska.

Data Sources. The FAA, NTSB and Garrett studies used the NTSB/FAA accident and incident database. The FAA and NTSB studies also fielded surveys. The FAA surveyed pilots in 1998, and the NTSB surveyed pilots and operators in 1995. The NTSB study also included interviews with Alaska aviation personnel; information from public forums; and a 1994 survey of commercial pilots and
operators conducted by the Ames Research Center of NASA. The Mitchell study is also survey-based. The study team interviewed air taxi operators and pilots. The Garrett study combined the NTSB database with statewide data on occupational deaths.

**Brief Summary.** The NTSB (1995) report examined commuter airline, air taxi, and general aviation accidents. The study focused on accidents during take-off and landing and accidents related to flying under visual flight rules (VFR) into instrument meteorological conditions (IMC). It identified VFR into IMC as the leading safety problem for commuter airlines and air taxis in Alaska. It also cited seven safety issues: (1) pressures on pilots and commercial operators to provide services in a difficult environment with inadequate infrastructure; (2) inadequate weather reporting; (3) inadequate airport inspections and airport condition reporting; (4) current regulations for pilot duty, flight, and rest time; (5) inadequacy of the current instrument flight rules system; (6) enhancements to the IFR system needed to reduce reliance on VFR and; (7) the needs of special aviation operations.

The FAA (1999) study has a narrower focus than the NTSB report. It examined controlled-flight-into-terrain (CFIT) accidents where VFR into IMC is listed as a causal factor. The aim of the FAA study was to identify differences between companies that had CFIT accidents and those that hadn’t. It found several statistically significant differences. Pilots who had not had CFIT accidents had more flying experience; perceived their company’s safety program as better than those of companies that had CFIT accidents; and relied less on station agents for pre-flight weather decisions.

Garrett et al. (1998) also examined CFIT accidents as part of a larger study comparing fatality rates in aviation and other occupations. The authors analyzed differences among pilots based on levels of training and experience and found that commercial and transport pilots were significantly more likely to have IMC conditions at the crash site than were pilots holding private pilot’s licenses.

Mitchell (1982) focused on air taxi operations and interviewed 177 air taxi pilots. The study was the basis for designing a training program suited to the conditions pilots in Alaska face. It identified decision-making skills and operational procedures that are necessary for operations in Alaska’s weather and environmental conditions. Based on the interviews, the study team found that lack of weather information and communication facilities; management policies; and insufficient decision-making skills combined with rapidly changing weather and difficult terrain to make flying in Alaska hazardous. A large share of pilots interviewed cited overloading; incomplete weather information; pressure to fly in marginal conditions; lack of training in mountain flying and off-airport take-offs and landings; pilots with alcohol problems; and violations of the 8-hour rule as being safety problems. Pilots also noted that profit motives drove many management decisions to fly in unsafe conditions.

Berman et al (2001) provided the Federal Aviation Administration (FAA) with information on air safety and aviation infrastructure in the Yukon-Kuskokwim Capstone program area as of January 1999, just before Phase I of the program began. The data established a baseline to enable the University of Alaska Anchorage to conduct an independent study assessing the safety effects of Capstone. The report focused on air carriers conducting passenger and cargo operations under parts 121 and 135, respectively, of the Federal Aviation Regulations (FAR; 14 CFR, Chapter 1), since aircraft owned by these companies serving the Bethel area were scheduled to receive Capstone avionics. However, general aviation aircraft also operate in the area, as do a limited number of military planes and private carriers not regulated under parts 121 and 135. Therefore the baseline report took into account the safety record of aviation overall in the study area. The report included safety incidents occurring in the previous 10 years, with emphasis on the safety record from 1995 to 1999.

The ISER Capstone Phase I Interim Safety Study 2000/2001 evaluated aviation safety changes in the Yukon-Kuskokwim Capstone area through the end of 2001. ISER first analyzed data for the period 1990-1999, before the Capstone program started. Researchers quantified the scarcity of navigation aids and weather information for pilots flying in the Yukon-Kuskokwim (Y-K) Delta. They then looked at
accidents and found that if the new technology had been installed on all aircraft in the test region during the 1990s, it might have prevented about 1 in 7 of all accidents and nearly 1 in 2 fatal accidents, by mitigating all causes of the accidents; and helped pilots avoid more than half of all accidents and fatalities, by mitigating some but not all of the causes of the accidents.

Preliminary recommendations included continuing the Capstone program; marketing the program to operators and pilots; insuring adequate pilot training; expanding ground-based transceiver coverage; providing radar-like approach control services; and requiring more operator feedback.

Kirkman (2002) provided an interim assessment of Capstone in the Y-K Delta region, comparing accident rates in the delta before and after implementation of Capstone and reporting on implementation in the region. The author compared accidents by type and by Capstone equipped and non-equipped aircraft. Kirkman concluded that “the Capstone program made significant progress toward implementing safety and efficiency capabilities for commercial aviation for the Y-K Delta.” He noted that important steps like pilot training and surveillance infrastructure were not yet fully implemented in the region.

Relevance to the Capstone Project and its Evaluation. All seven of these studies are relevant for the Capstone evaluation. The FAA, NTSB and Garrett, et. al. are relevant because they provide detailed information about CFIT accidents. All three studies recommend using global positioning systems (GPS) to reduce accidents caused by flying under VFR into IMC; improving weather reporting services at VFR-only airports; and using GPS technology to expand the IFR route structure. The Mitchell study provides a detailed discussion of accident causes and factors that Capstone avionics don’t address. It helps us to understand cases where these avionics have little or no effect on safety. The MITRE report and baseline and interim reports from ISER provide illustrative and key evaluation of the existing status of aviation conditions in Alaska and the implementation of Capstone in the Yukon-Kuskokwim area.

Recommendations Relevant to the Safety Study Design. From the FAA study, we plan to use both the survey data and the research findings and recommendations. We will use the survey data to see if there are differences between pilots flying in southeast Alaska and in the rest of the state, and to identify factors in accidents that Capstone doesn’t address and that we need to control for. These factors include risk-taking behaviors; company operations; training; and safety policies and procedures. In our study design we are using findings and recommendations from the NTSB, Garrett, and Mitchell studies. The Mitchell study also confirmed that pilots are somewhat reluctant to be interviewed, fearing punitive action. Our experience in southwest Alaska confirms this finding, although some pilots and operators have become more open and candid as the study progresses. Also, southwest Alaska pilots tended to initially be more optimistic about both benefits and potential problems of the Capstone program than they are after experience with the program; we expect to see this same pattern in southeast Alaska.
2. Aviation Accidents and Incidents in the Capstone Southeast Alaska Region

2.1. Summary

Section 2 reviews accidents statewide and in the Capstone SE Alaska region from 1990 through 2002. It discusses total accidents and fatal accidents by type of carrier; estimates accident rates for the state and region; and identifies accidents that Capstone avionics could potentially have prevented, had they been in place.

Between 1990 and 2002, accidents and incidents in the Capstone SE Alaska region made up about 11 percent of the statewide total (241 of 2,151). Within that region, FAR part 135 operators accounted for 42 percent of accidents (97 of 233). Most accidents involving part 135 operators were on non-scheduled flights (54 of 97). Accident rates from 1990 through 2002 were lower in the region than in state as a whole, but fatality rates were higher.

The Capstone program could potentially have prevented 22 percent of accidents in the Capstone SE Alaska region from 1990 through 2002, had the program been in place. The potential effects of the Capstone program are strongest for fatal accidents. More than half of all fatal accidents in the region during this period were potentially preventable by Capstone avionics, training, and data.

2.2. Accidents in Alaska and the Capstone Southeast Alaska Region

Data covering accidents and incidents come from NTSB Aviation Accident and Incident database. We got access to the data using the NTSB Website http://www.ntsb.gov/ntsb/query.asp. Accident and incident data in this report cover the period from January 1, 1990 through December 31, 2002. We used latitude and longitude information to create a subset of data covering southeast Alaska. We categorized accidents by Federal Aviation Regulations (FAR) part number,2 scheduled and non-scheduled service for the Capstone SE Alaska region and the entire state.

Table 2-1 summarizes data for the state and region for 1990 through 2002. It breaks out the total accidents and incidents, accidents, fatal accidents and fatalities by type of operation for the Capstone SE Alaska region and Alaska as a whole.

The NTSB data include all the accidents but only a subset of the incidents—generally those that were downgraded from accidents—that are reported to the FAA. Of the 60 incidents statewide in this period, eight were in the Capstone SE Alaska region. The table shows that from 1990 through 2002:

- 233 accidents occurred in the Capstone SE Alaska region, with 54 resulting in fatalities. The share of accidents with fatalities (23 percent) was more than twice as high in the region than in the state as a whole (11 percent).
- Air taxis accounted for 24 percent of accidents and 41 percent of fatalities in the region.
- Commuters accounted for 4 percent of accidents in the region (10 out of 233), 2 percent of fatal accidents (1 out of 54) and 3 percent of fatalities (4 out of 126).
- Part 135 operators flying as Part 91 accounted for 14 percent of accidents (33 out of 233), 13 percent of fatal accidents (7 out of 54), and 11 percent of fatalities (14 out of 126).

---

2 We used information on type of flight, owner and operators to identify part 135 operators flying as part 91.

Figure 2-1 shows that the number of accidents in Alaska has been declining since 1990. Three-year moving averages have dropped from 183 in 1990-1992 to 135 from 2000-2002. The trend in southeast Alaska is less clear, but appears to be declining as well, moving from an average of 22 per year from 1990-1992 to 14 per year from 2000-2002. Total accidents in the Capstone SE Alaska region during this period ranged from 11 to 27 annually.

Figure 2-1: Accidents in Alaska and Southeast, 1990-2002

Source NTSB (1990-2002) Accident and Incident Databases
Figure 2-2 shows accidents in the Capstone SE Alaska region from 1990 through 2002 by FAR part number. Accidents involving part 135 operations are commuters, air taxis, and part 135 flying as 91. Of all accidents, air taxis and 135 flying as part 91 made up the largest share.

**Figure 2-2. Accidents in the Capstone SE Alaska Region by FAR part number.**

Source NTSB (2003) Accident and Incident Database

2.3. **Accident Rates**

To construct accident rates we need data for both the numerator—the number of accidents—and the denominator—the amount of flying, which is often measured in departures, hours flown, or enplanements. We have excellent data on accidents, and all our rate calculations use the same accident data. The accident and fatality counts for Alaska and the Capstone SE Alaska region come from the NTSB accident and incident database. Accident and fatality counts for the U.S. come from FAA (1999) *Accidents, Fatalities and Rates, Preliminary Statistics*. As discussed above, we will look at incident rates in more depth later in the study. Data on departures, hours flown, or enplanements in southeast Alaska are all limited. We carefully reviewed the available data sets with staff from FAA, BTS, NTSB, and NIOSH.

- U.S. Bureau of Transportation Statistics (BTS) data include departures and flight hours. However, these data are available only at the company and state level and not for regions within the state. Also, they show only the commuter departures and hours of part 135 air carriers and do not include unscheduled flights.

- The national General Aviation and Air Taxi Survey provides an estimate of total Alaska flight hours for unscheduled air taxi and general aviation operations, as well as scheduled commuter service. However, the data are reported at the state level, and it is not currently possible to extract numbers for southeast Alaska.

- The APO Terminal Forecast Survey Summary Report from the FAA’s Aviation Policy and Plans Office uses historical data on traffic counts from FAA Form 5010, the Airport Master Record. This is the only systematic data available for the Capstone SE Alaska region. For airports with control towers, airport managers report the number of aircraft cleared for takeoff or landing. For airports without towers, which include many southeast Alaska airports, airport managers estimate the annual traffic counts. We have made rough estimates of annual departures by dividing the traffic counts by two. This method assumes that each departure results in a traffic count at both the departing and the arriving airport. It undercounts unscheduled air taxi and general aviation departures, since it would not count departures from off-airport locations.
Table 2-2 shows accident and fatality rates for air taxis, commuters, and FAR part 135 flying as part 91 and for general aviation from 1998 through 2002. The accident and fatality counts come from the NTSB database. Departure data come from the APO Terminal Area Forecast. During that period, accident rates for part 135 operators in the Capstone SE Alaska region were lower than for the state—5.8 per 100,000 departures, compared with 9.9 statewide. But fatality rates were slightly higher—3.7 per 100,000 departures in southeast and 3.2 statewide. General aviation accident rates were also lower in the Capstone SE Alaska region—10.3 per 100,000 departures, compared with 13.2 statewide. Fatality rates were higher—4.0 per 100,000 departures compared with 1.5 statewide.

| Table 2-2. Estimated Accident and Fatality Rates per 100,000 Departures: Air Taxis, Commuters and General Aviation for Alaska and Southeast Alaska, 1998-2002 |

Sources:
1. NTSB (2003) Accident and Incident Database

Notes:
a. Departure data for Air Taxis and commuters do not count at private airports or off-airport sites. We assume that FAR part 135 air carriers operating under part 91 are counted in air taxi and commuter departures.
b. General Aviation is from APO Terminal Area Forecast reports. We assume this is FAR part 91

c. FAR public accidents and fatalities are counted in General Aviation

2.4. Accidents Potentially Preventable by Capstone Equipment

The Capstone program includes safety enhancements that may be able to prevent accidents from a wide variety of causes. The avionics, training, and data provided by the Capstone system are more likely to help pilots avoid some types of accidents than others. We looked at accident narratives and causal information in the NTSB dataset for each accident in the Capstone SE Alaska region and determined whether having Capstone avionics and training could have helped prevent the accident.

Figure 2-3 divides 231 accidents in the region from 1990 through 2002 into ten basic cause categories. The inner pie shows all accidents divided into the ten major categories. The extensions show more details of causes within the major categories. Remember that a large share of FAR part 135 operations in southeast Alaska are by float planes flying under Visual Flight Rules (VFR) in the summer.

Capstone avionics, training and data can help pilots avoid CFIT accidents, collisions between aircraft, and some accidents where flight information is a factor. From 1990 to 2002 in the Capstone SE Alaska region, about 23 percent—52 of the total 231 accidents—might have been prevented if the Capstone program had been in place.

³ Table 2.1 reports 233 accidents in Southeast from 1990 to 2002. Two of the accidents do not have narratives in the database so these figures cover 231 accidents. Appendix A contains text summaries and coding of accidents in Southeast.
Figure 2-3: Accidents in Southeast by Cause, 1990 - 2002

Nine Basic Cause Categories
1. **Mechanical**: Engine failure, inoperable control surfaces, failed landing gear or floats, propeller or shaft failure.
2. **Navigation**: Controlled Flight into Terrain (CFIT) while en route is often associated with reduced visibility and small navigational errors. Some CFIT accidents are due to pilots being off-course.
3. **Traffic**: Usually mid-air collisions. Also includes ground or water accidents from last-moment avoidance of other aircraft and from jet blast on airport surface.
4. **Flight Information**: Usually accidents that result from inadequate weather information and are often caused by icing and sometimes poor visibility but rarely convective weather. (Surface winds contributing to take-off or landing accidents have been included under take-off or landing rather than here.)
5. **Fuel**: Accidents caused by running out of fuel.
6. **Flight Prep**: Accidents caused by a variety of poor flight preparation measures, including failure to insure that cargo is tied down and within the aircraft’s weight and balance limits and failure to check if fuel has been contaminated by water.
7. **Takeoff**: Accidents during take-off, including pilots’ failure to maintain control in wind, improper airspeed, waterway debris, hazards at remote lakes, rivers without markings or moorings, poor runway conditions and obstacles at off-runway sites.
8. **Landing**: Accidents during landing, including pilots’ failure to maintain control in wind, improper airspeed, waterway debris, hazards at remote lakes, rivers without markings or moorings, poor runway conditions and obstacles at off-runway sites.
9. **Other**: Includes colliding with watercraft or ground vehicles, hitting birds and pilots under the influence of alcohol or drugs.
10. **Unknown**: Missing aircraft, cause not determined.

Detailed Cause Categories
**Capstone Relevant Causes**
1. **Weather**: Accidents where the availability of weather information was a factor.
2. **CFIT**: Controlled Flight into Terrain (or Water) accidents
3. **TCF**: CFIT accidents that occur on approach or departure.
4. **Map**: Accidents where the pilot did not know aircraft’s location
5. **Midair**: Midair Collisions between aircraft.
6. **Runway**: Collisions between aircraft on the ground or water.

**Other Causes**
7. **Runway**: Accidents on take-off or landing related to runway or waterway conditions such as potholes, submerged obstacles the runway
8. **Site**: unusual hazards of water or off-runway sites
9. **Water taxi**: collisions with objects (not a/c) while taxiing on the ocean, rivers or lakes.
10. **Maneuvering**: Typically, stalling the aircraft while maneuvering

Source: NTSB (2003) Accident and Incident Database
Figure 2-4 shows the causes of the 54 fatal accidents in the Capstone SE Alaska region from 1990 through 2002. Capstone could potentially have prevented a much larger share of fatal accidents than of total accidents. More than half of the 54 fatal accidents in the region had causes that Capstone avionics, training, and data address. Most fatal accidents were CFIT accidents, either in cruise flight or on approach or departure. Fatalities in float plane accidents are often pilot or passenger drowning.

Source: NTSB (2003) Accident and Incident Database
3. Commercial Operations

Information in this section is from several FAA sources and U.S. Bureau of Transportation Statistics. The scope of operations—and in some cases the operators themselves—in the Capstone SE Alaska region change over time. Data on air operations within the region are limited. Departure and enplanement data collected by the U.S. Bureau of Transportation Statistics (BTS) record only scheduled passenger and cargo flights. The only systematic regional data available during the baseline period (1997-2001, with preliminary data for 2002) come from the Terminal Forecast Survey Summary Report, produced by the FAA’s Aviation Policy and Plans Office (APO). The APO compiles historical traffic counts from FAA Form 5010, the airport master record.

In Juneau, the air traffic controllers report the number of aircraft cleared for take-off or landing. At all other airports in the region, airport managers provide estimates of annual traffic counts. We estimated annual departures by dividing the traffic counts by two. As a result, this method undercounts operations to and from off-airport locations.

In addition, operations data from 1990 to 1996 had fluctuations that could not be attributed to any credible reason. It is difficult to ascertain why the earlier data had these fluctuations, except that many airports without towers did not begin reporting estimates until 1996. Because the data from 1990 to 1996 is likely an inaccurate representation of operations, we have limited our analysis to operations data from 1997 to 2001, with preliminary data for 2002.

3.1. Terminal Operations

Terminal operations information for the Capstone SE Alaska region is from the FAA Office of Aviation Policy and Plans Terminal Area Forecast System. There was little variation in the number of terminal operations reported in the region from 1997 to 2002. Air taxis and commuters comprised more than half (54 percent) of the total regional operations during that period (Figure 3-1).

Figure 3-1: Capstone Southeast Alaska Region Terminal Operations 1997-2002

![Terminal Operations Chart]

Source: FAA Office of Aviation Policy and Plans Terminal Area Forecast System

---

Figure 3-2 shows terminal operations for the entire state of Alaska from 1997 through 2002. Overall and within each category, the number of operations remained relatively constant. Air taxis and commuters represented the largest share (38 percent) of operations statewide.

**Figure 3-2: Alaska Terminal Operations 1997-2002**

3.2. Air Carriers and Commercial Operators

Table 3-1 lists the 40 FAR part 135 operators flying in Capstone’s SE Alaska region as of January 2003. Several of these also operate under part 133. These carriers account for most commercial flights in southeast Alaska. Ten operators have their main office presence in Juneau, nine in Ketchikan, five in Cordova, three in Petersburg and Sitka, and ten in smaller communities. These companies employ about 242 pilots, with the largest share (41 percent) employed in Ketchikan, followed by Juneau with approximately 33 percent. These operators fly to most airports in the region, as well as some places outside the area.

3.3. Employees

The majority of the southeast Alaska operators are very small. Table 3-2 groups the 40 companies by the number of pilots they employ. Most (26) are small, employing between one and three pilots. The other 14 companies are about equally divided between those that employ between 4 and 10 pilots and those that employ 11 or more.

Table 3-3 lists all employees, not just pilots, of the 40 operators in the Capstone SE Alaska region. Keep in mind that some of the operators fly outside as well as within southeast Alaska. The table shows all employees, by job title, (taken from the VIS) of these companies, not just those employees involved in southeast Alaska operations. Over half of the companies have five or fewer employees and over a third are one-person operations. The two largest firms, however, each employ more than 100 persons, including not only pilots but also dispatchers, maintenance personnel, and others.

3.4. Aircraft as of June 2001

As of June 2001, companies supervised by the Juneau flight standards district office (FSDO) operated 231 aircraft under FAR part 135. Those are shown by type in Table 3-4. Among the aircraft operating under part 135 in 2001, all 51 helicopters and about 7 percent (12) of the 180 fixed wing aircraft had turbine engines. In addition to the aircraft shown in Table 3-4, there were 93 helicopters certified for operations under FAR part 133 (rotor wing external load) and part 137 (agricultural aircraft). Most of these support logging operations, and many of them are also certified to operate under part 135, and so are included in the 51 helicopters in Table 3-4.

3.5. Avionics

The information on avionics in aircraft used by Capstone SE Alaska region operators in 2001 is taken from the VIS (June 1, 2001), photos of cockpit configurations, owner-operator interviews and data from the FAA’s FSDO employees who oversee the operation certificates.

The avionics in these aircraft vary widely, from the minimum required for night VFR to full IFR panels with redundant systems. For example, one aircraft certified for day and night VFR operations is equipped with a single Nav/Com 360 channel radio with VOR receiver. Another twin-turbine aircraft has a much more sophisticated avionics suite and is certified for IFR operations as well as operations in known and forecast icing. Its avionics include dual 720 channel communications radio, dual VOR receivers with ILS and LOC capability, dual DME receivers, dual ADF receivers, dual GPS navigators, transponder, radar altimeter, and weather radar.

The aircraft listed in this baseline study as VFR aircraft generally have radio packages using navigation equipment that is not certified for IFR operations. In most cases the equipment is the original delivered with the aircraft and is therefore at least 20 years old. Operators also install radios that do not meet any FAR requirements and are only for company convenience. These are typically CB radios or marine radios used to talk to station agents in the villages.
4. Capstone Southeast Alaska Region Aviation Facilities

4.1. Airport Facilities

There are 84 landing facilities in the Capstone SE Alaska region (Table 4-1): 24 airports, 52 seaplane bases, and 8 heliports. Appendix B gives a full list. Most of the facilities—71, or 85 percent—are available for public use. The State of Alaska owns about half (41 of 84) of the facilities. Table 4-2 below shows that five publicly owned heliports and two publicly owned airports are not available for public use; ten privately owned seaplane bases are available for public use.

Most of these facilities have single runways with minimal navigation, weather monitoring, or other services. Only Juneau International Airport has a control tower. The majority of these facilities (64 of the 84) are unattended, and about half of those attended are during daylight hours only. Only 14 facilities have lighting—13 of the 24 airports, no heliports and one seaplane base (Table 4-3). Fuel is available at 21 facilities—ten airports, ten seaplane bases and one heliport—and repairs at 16 facilities (Table 4-4).

4.2. Runway Characteristics

Airports in the Capstone SE Alaska region have 32 runways (28 land runways and 4 water runways), and seaplane bases have 55 water runways and one wooden helicopter pad. Half of the airport runways are paved, one-quarter are gravel, and the remainder are turf or water (Table 4-5).

Airport runway lengths range from 1,100 feet (East Alsek River) to 8,456 feet (Juneau International); more than half are less than 150 feet wide (Tables 4-6 and 4-7). Water runway lengths range from 1,000 feet (Excursion Inlet) to 10,600 feet (Bell Island Hot Springs); nearly a third are less than 1,000 feet wide (Tables 4-8 and 4-9).

4.4. FAA Facilities

The FAA operates a tower in Juneau and flight service stations (FSS) in Juneau, Ketchikan, and Sitka. The Juneau tower operates from 0600 to 2300 hours (local) from May through September, and 0700 through 2100 hours (local) from October through April. The Juneau and Ketchikan flight service stations operate 24 hours a day, 7 days a week; the Sitka FSS is open from 0600 to 2145 (local), 7 days a week. These facilities provide services to pilots, including weather briefings and traffic control (Juneau tower) or traffic management (the flight service stations).

4.5. Communications Facilities

Communications for pilots flying in the Capstone SE Alaska region are provided by FAA facilities (FSS and towers) and by remote communications outlets (RCOs), remote tower relays (RTRs), and remote communications air to ground facilities (RCAGs) (Table 4-11). The FAA’s Pilot/Controller Glossary describes these facilities as follows:

Remote Communications Outlet (RCO): An unmanned communications facility remotely controlled by air traffic personnel. RCOs serve FSSs.

Remote Transmitter/Receivers (RTRs): serve terminal ATC facilities. An RCO or RTR may be UHF or VHF and will extend the communication range of the air traffic facility. There are several classes of RCOs and RTRs. The class is determined by the number of transmitters or receivers.
Classes A through G are used primarily for air/ground purposes. RCO and RTR class O facilities are nonprotected outlets subject to undetected and prolonged outages. These facilities were established for the express purpose of providing ground-to-ground communications between air traffic control specialists and pilots located at a satellite airport for delivering en route clearances, issuing departure authorizations, and acknowledging instrument flight rules cancellations or departure/landing times. As a secondary function, they may be used for advisory purposes whenever the aircraft is below the coverage of the primary air/ground frequency.

Remote Communications Air/Ground Facility (RCAG): An unmanned VHF/UHF transmitter/receiver facility used to expand ARTCC air/ground communications coverage and to facilitate direct contact between pilots and controllers. RCAG facilities are sometimes not equipped with emergency frequencies 121.5 MHz and 243.0 MHz.

4.6. Weather Reporting Facilities

Weather data are limited both by the number of reporting stations and by the quality of data they report. The quality of data from any of these sources depends on the type of reporting station. In the Capstone SE Alaska region, there are a number of different station types but most airports have no reporting stations. Weather-reporting stations in the region include:

- **Automated sites:**
  Automated Surface Observation System (ASOS)
  Automated Weather Observation System (AWOS).
  Both types of automated sites report visibility but do not report what phenomena might be obscuring it. For example, one half-mile visibility could result from snow or fog or some other weather condition that we would be unable to determine.

- **A-Paid stations** are remote, non-aviation weather facilities reporting to the NWS for forecasting. These stations gather supplemental weather data at remote locations like lodges to assist the NWS in developing forecast models. A-Paid sites may be of interest to aviators if they are in mountain passes and report visibility. They may be limited by time, either time of day or seasonality.

- **FAA Contract Weather Observation Station (FCWOS),** a station paid by the FAA to provide weather observations; may be limited by time, either time of day or seasonality.

- **Limited Aviation Weather Reporting Stations (LAWRS),** these provide ceiling and visibility information and may be limited by time, either time of day or seasonality.

- **Weather Service Office (WSO),** manned; provides area forecasts and terminal forecasts.

Table 4-12 lists the number of each type of weather reporting stations; because some locations have multiple types of weather station, the 24 stations are in only 18 locations. Table 4-13 lists the weather facilities by location.

</table>

Note: Weather facilities are counted in each reporting type category that is applicable; the same facility may be listed in more than one type category.

Source: NWS at http://www.alaska.net/~nwsar/station-identifiers.html, July 5, 2001
Almost all the current weather observations for pilots in the region are from 16 automated weather stations. As table 4-13 shows, there is some level of staffing at 7 of the 18 locations (the four A-paid, two FCWOS, the LAWRS and the WSO), but 24-hour automated observations at those locations provide most of the weather information pilots receive.

In addition to weather reporting stations, pilots can now access “Weather Cams” over the internet. These cameras provide pilots with internet access a real-time look in several directions from the camera location, and in some cases a loop showing hourly weather images over the preceding several hours. Cameras may be off-line, or pilots may not have adequate internet access to use them. However, pilots and operators have generally been very positive about weather cameras, and they add significantly to the current weather data available to pilots before they take off. There are nine weather camera locations in the Capstone SE Alaska region (Table 4-14).

5. Safety programs

5.1. FAA Requirements

Air carrier safety programs vary from extensive systems of procedures and training requirements to one-page statements of safety goals. Requirements for safety programs vary according to which federal aviation regulations (FARs) govern the flights a carrier operates. In general, carriers that operate under part 135 have wide latitude about how they structure and operate their safety programs. There are no requirements under part 135 for a director of safety or a formal safety program.

After the initiation of Capstone Phase I in southwest Alaska and prior to the initiation of Phase II in southeast Alaska, the Alaska Air Carriers Association began a safety initiative now funded as the Medallion Foundation. This program is designed to help air carriers improve their safety records by operating at a higher standard than is required. At the time of this report, five of the FAR 135 operators eligible to participate in Capstone in southeast Alaska are participants in the Medallion program and are building significant safety programs. The Medallion Program description is available at http://www.medallionfoundation.com.

5.2. Operator Safety Programs

All the air carrier certificates held by the Juneau Flight Standards District Office (FSDO) are either FAR 133 or 135 (Table 3-1). The FAA does not require directors of safety for air carriers operating under these regulations. Although they are not required to have directors of safety, the five southeast Alaska operators that are Medallion participants do have directors of safety and defined safety programs. None of the non-Medallion operators have defined safety programs. Discussions with operators made it clear they are unlikely to establish such programs unless required to do so under FAR 133 or 135.

None of the potential Capstone operators in southeast Alaska are required to use certificated aircraft dispatchers. Although some operators do use dispatchers, they are all defined in the operations manuals as flight followers or schedulers. Flight followers and schedulers are not directly responsible for any safety decisions. They provide flight following as part of their duties, which include aircraft and crew scheduling duties. Safety decisions, including Go/NoGo decisions, are the responsibility of the pilots, chief pilots, and directors of operations for these operators.

6. FAA Surveillance

The Federal Aviation Administration’s Alaskan Region has one Flight Standards District Office in Juneau (designated FSDO-5) supervising air carriers in southeast Alaska and westward along the Gulf of Alaska as far as Cordova. The FSDO has air carrier safety inspectors for each operator in its area. Different inspectors cover operations, airworthiness, and avionics; they may be assigned only one air carrier or a number of air carriers, depending on the size and complexity of those carriers.

There is not a single focal point of aviation activity in the Capstone SE Alaska region. Operators fly from numerous bases, including Ketchikan, Juneau, Sitka, Cordova, Yakutat, Wrangell, Petersburg and Anchorage. The inspectors from Juneau and Anchorage travel widely in the region to provide operator surveillance.
7. Weather

7.1. Common Weather Hazards in the Capstone SE Alaska Region

Aviation weather hazards in the Capstone SE Alaska region include several conditions that create poor visibility and low ceilings. The FAA’s Advisory Circular 00-6A on aviation weather defines the common weather hazards. Historical weather reports allow us to estimate how frequently these hazards occur and how often the weather conditions approach operational limits as defined in FARs. However, as we will discuss below, historical and current weather data are often not adequate for precise measurements of “how often” and “how much of the time.”

Fog is a surface-based cloud of water droplets or ice crystals. It is the most frequent cause of surface visibility below 3 miles, and is one of the most common and persistent weather hazards in aviation (AC 00-6A pg. 126). Two types of fog occur frequently in southeast Alaska and along the Gulf Coast. Advection fog forms when moist air moves over colder ground or water. It is most common along coastal areas (AC 00-6A pg. 127). Ice fog occurs in cold weather when the temperature is below freezing (AC 00-6A pg. 128). Sunshine during the day can warm the fog and lift fog layers off the surface or evaporate them; however, fog tends to persist during the short hours of daylight during the winter.

Low stratus clouds may reduce ceilings below minimum safe levels. In many cases there is no line of distinction between such clouds and fog; one gradually merges into the other. Visibility may approach zero (AC 00-6A pg. 128). High winds over snow-covered terrain create blowing snow that can reduce visibility to near zero at ground level, even under clear weather conditions (AC 00-6A pg. 130).

Finally, precipitation—rain, snow, drizzle, freezing drizzle, and freezing rain—commonly presents ceiling and visibility problems.

7.2. Weather Variability

Capstone’s Southeast Alaska region stretches from Cordova to the south tip of Prince of Wales Island, the most southern portion of Alaska. The area is a marine environment with extremely variable weather and frequent storm systems with low ceilings and fog. Many destinations in the area do not have weather reporting facilities. Operators depend on area forecasts and pilot reports to make Go/NoGo decisions. Some flight routes have long distances between weather stations; for example, the route from Yakutat to Sitka is 201 nautical miles between weather stations.

Table 7-1 shows examples of flight routes without enroute or destination weather reports. All these routes are entirely in coastal areas where advection fog is common due to moist air being moved onshore by normal cyclonic flow around lows and cooled by cold ground. This often results in destination weather with low ceilings and visibility. Aviators may fly longer than one hour—assuming a cruising speed of 110 nautical miles an hour for the typical single-engine aircraft used in southeast Alaska—on some routes without the benefit of weather reports.

7.3. Weather Data Summary

Analyzing weather is an important tool in comparing activities over the course of this study. Several organizations compile historical weather data:

1) The National Weather Service, in cooperation with the U.S. Army Corps of Engineers, and the Institute of Agricultural Sciences, University of Alaska  
2) The Environmental Data Service and Air Weather Service of the U.S. Air Force  
3) The Alaska Weather Almanac  
4) NOAA records of historical weather (the Alaska Climate Data Center contains archives of NOAA weather observations for all locations in Alaska from 1992 to the present.)  
5) The Western Regional Climate Center (WRCC) is one of six regional climate centers in the United States administered by NOAA’s National Climatic Data Center. The WRCC performs several distinct functions, including maintaining historical climate databases for western states observation stations and responding to public inquiries for climate information.

For this analysis we obtained a consistent and complete set of weather data for the entire period from the Western Regional Climate Center. We received hourly ASOS reports, taken from NWS and FAA stations in the region. Table 7-2 shows weather reporting locations we used for our analysis and type of report each provides. Data came in the form of delimited text; we imported the data into SPSS, and then cleaned the data using a combination of syntax scripts and visual inspection. Cleaning the data included dropping corrected observations, assuring that values appeared in the respective fields, and picking out instances of repeated observations. We then matched in data from the U.S. Naval Observatory identifying civil twilight each day, allowing us to categorize observations by day and night.

We wanted to summarize the weather over a period of time, so we could later compare weather during the study period with weather during the baseline. We categorized each weather observation based on the classes described in Table 7-3, and generated tables and graphs by aggregating data by day and month, night and day, and community, and then by weather class.

Weather Observations

Figures 7-1 to 7-4 show the percentage of total observations within each weather class (zero to five) that occurred during the daytime. Looking across from 1998 to 2002, we can see that the weather is fairly consistent year to year in all locations. There was very little annual variance, with the exception of the years 1998 and 2001. The data suggest that during these two years there was a higher frequency of observations above Basic VFR conditions overall. The difference, however, does not suggest any extreme annual weather changes in the region as a whole.

Figure 7-1

Figure 7-2

U.S. Naval Observatory [http://aa.usno.navy.mil/data/docs/RS_OneYear.html](http://aa.usno.navy.mil/data/docs/RS_OneYear.html)
Figures 7-5 to 7-12 graph the percentage of days and nights during which there was at least one observation when the weather was below basic Visual Flight Rules criteria (class 2 from table 7-3). We present the data by month (e.g., the average of the five January months, 1998 to 2002) to illustrate how typical weather varies by month. Note that there are more daytime observations during summer months and fewer during the winter. Figures 7-5 and 7-6 show Juneau day and night data, 7-7 and 7-8 show Ketchikan, 7-9 and 7-10 show Sitka, and 7-11 and 7-12 show Yakutat. This set of figures focuses on how often the weather is bad in each community.

We have not analyzed how long those good weather periods lasted, and on some days the good weather was probably brief. For example, Juneau December weather observations show many low-classed (poor weather) and high-classed (good weather) observations. That means that pilots may take off in good weather but return in poor weather. Figures 7-21 to 7-28 show how many days each month showed this sort of variable weather. This occurrence is graphed out in figures 7-21 to 7-28 as the percentage of days with variable weather.

We define variable weather days as those on which the best weather observation met Basic VFR minimums of 1,000’ ceiling, 3 miles visibility and the worst weather observation did not meet Day En Route VFR minimums of 500’ ceiling, 2 miles visibility. These days represent higher danger because the weather changes markedly. On such days, pilots may be lured into flight during the good weather moments, but the weather may deteriorate before the flight is finished. Taking Juneau for example, the graph of variability (days with good and bad weather, 7-21) is nearly the same as the graph of below VFR days (7-5). With nearly every bad-weather day including some time with weather good enough for VFR flight, the scenario above can occur frequently. It is important to note these monthly and daily trends while trying to incorporate weather information and flight safety. Many accidents are weather or visibility related, so understanding the variance of weather as well as its typical trends can help explain this correlation.

8. Baseline Surveys

8.1. Purpose

To assess the effects of the Capstone program on air safety in its southeast Alaska region, we need to control for other factors that might also affect safety in that area. Among those are changes in the qualifications and experience of Capstone area pilots during the study period; changes in company operations and policies; and other safety initiatives in the region. To assess how these factors might change, we collected baseline data from air carriers supervised by the Juneau FSDO and from their pilots.

These surveys were part of a larger effort to collect information about qualifications, practices, and attitudes of pilots and company management for aviation operators in Alaska. ISER developed and conducted most of these surveys as part of a contract with the National Institutes for Occupational Safety and Health (NIOSH) in the fall and winter of 2001/2002, and we conducted additional surveys in April 2003. Those surveys added three companies that had not been part of our initial sample and added Capstone attitude questions as well. Full details of our survey methodology, copies of the survey instruments, and frequency counts are included as appendices.

8.2. Results

Operators

Our operator survey universe consisted of all the air carriers supervised by the FAA’s Juneau Flight Standards District Office (FSDO) and pilots who worked for them. Our NIOSH sampling design called for attempting to interview all operators who employed three or more pilots, and interviewing a sample of operators with only one or two pilots. We obtained 20 operator interviews and 38 interviews with southeast pilots in 2001/2002, and added three more operators when we returned in April 2003. Table 8-1 shows the operators we interviewed.

Survey results covered a wide variety of topics. These operators ranged from employing only one pilot to as many as 27 pilots (while at their peak summer operations). Seasonality of pilot employment was evident; on average, the number of pilots employed across all 23 companies was 7.96 in the summer and only 3.24 in the winter. Reflecting the importance of air taxi and charter service to southeast aviation, companies flew, on average, more than twice as many unscheduled hours as scheduled: 2,248 unscheduled hours in 2000, compared with 1,006 scheduled hours that year. The importance of unscheduled service is further underscored by the fact that only about 30 percent of our respondents thought that on-time delivery of cargo, passengers, or mail was “very important” to the financial success of their company—about the same share as those who said such factors didn’t apply to their companies.

Together, the companies we surveyed accounted for about 80 new pilot hires each year. They cited a variety of qualifications as important in hiring, including experience flying in southeast Alaska, pilot safety history, recommendations, flight evaluation, ability to handle stress and make good decisions, maturity, attitude, personality, and formal training.

We asked whether company management thought that each of 17 possible safety measures could be very effective, somewhat effective, or not effective at improving aviation safety in Alaska. We then asked them to pick the three most important. Table 8-2 shows the result of this ranking. Although pilot training for better decision making was the highest ranked single measure, four of the five weather-related measures ranked in the table—so weather information was clearly the greatest concern.

Operator Opinions about Capstone

In April 2003, we asked 12 southeast operators, all of whom had some familiarity with Capstone’s Phase II program, about their expectations for and beliefs about Capstone. We asked first about 11 potential benefits to aviation in southeast Alaska, asked what other benefits (if any) they expected to see, and which three benefits they thought were the most important. Table 8-3 summarizes which benefits most operators expect to value the most.

<table>
<thead>
<tr>
<th>Benefit</th>
<th># of Responses</th>
</tr>
</thead>

</tr>
<tr>
<td>c. Safer flying in minimum legal VFR conditions</td>
<td>1</td>
</tr>
</tbody>
</table>

Unsurprisingly, the benefits Capstone was primarily designed to provide—terrain awareness and fewer mid-air collisions—are at the top of the list. Southeast operators also rated search and rescue highly, perhaps because of Capstone’s successful use during a recent search in southwest Alaska. We did not ask about every aspect of potential benefits. Several operators cited as “other benefits” new minimum enroute altitudes for some southeast Alaska routes, although these did not make their “most important three” lists.

We asked about potential Capstone problems stemming from heavier cockpit workloads, less heads-up time, or congested point-to-point routes. Most of our respondents (10, 7, and 11 respectively) thought these would be at most minor problems. However, respondents cited as possible other problems overconfidence, using equipment to push the weather, and attempting to use the equipment to fly into instrument meteorological conditions while under visual flight rules. Several also cited concerns about their aircraft being grounded if Capstone equipment failed.

We asked why pilots might choose not to use Capstone equipment; most respondents (7) thought that the potential for the company to watch the aircraft was the only listed reason they agreed with; however, 7 also added that concern about the FAA watching aircraft was also a reason. Table 8-4 shows which of their concerns (both problems with the equipment and reasons not to use it) they considered among the three most serious.

### Pilot Characteristics

As with pilots throughout Alaska, pilots for our southeast operators have a wide range of experience. Their total flight time ranged from 1,500 to 26,000 hours and Alaska flight time from 300 to 26,000 hours. They averaged over 5,000 hours of flight experience. Not all were qualified and current to fly under instrument flight rules; almost 40 percent had never flown on instruments in Alaska.

As with many Alaska businesses, aviation is busy in the summer months. During peak season, pilots worked an average of 12 hours per day, at least 5 days per week. Figure 8-1 shows the distribution of their reported weekly work hours. Despite these long hours, fewer than one in seven of our pilots reported that fatigue made them wish they could decline a flight as often as once a month.

**Figure 8-1**

**Hours Worked per Week During Peak Season, Southeast Alaska Pilots**

- 40 or less: 29%
- 41 to 60: 27%
- 61 to 72: 37%
- more than 72: 7%
As in southwest Alaska, pilots in the southeast area are very concerned with the weather. We asked about how often they flew into unknown or changed weather conditions and about how accurate they found flight service station weather information. Over 90 percent reported that flight service station weather was accurate always or most of the time. However, as Table 8-5 shows, most also fly into unknown or changing weather on a regular basis. Over 80 percent do so at least monthly. All the pilots who responded told us that they had declined a flight for weather reasons while working for their current employer, and all reported that their employer supported their decisions.

</tbody>
</table>

The importance of weather was again shown in pilot responses to the same 17 potential safety measures that we asked operators about. Pilots, like operators, chose more training in pilot decision making as the most important (Table 8-6). Again like operators, pilots said more weather reporting was the second most important measure (although operators chose AWOS stations and pilots chose manned weather reporting). And again, pilots chose four of the five listed weather measures as among the most important. However, pilots saw other types of pilot training (beyond decision making) as also important.

</tr>
</tbody>
</table>
Finally, pilots in southeast Alaska did not see their jobs as extraordinarily dangerous. As Figure 8-2 shows, fewer than 10 percent thought that piloting was safer than other jobs, but similarly few thought that it was much more dangerous. About one-third thought that piloting is about as safe as other jobs and the largest group—just over half—thought it was just slightly more dangerous than other jobs.

**Figure 8-2.**

Appendix A. Southeast Accidents, 1990-2001

The table below summarizes Southeast Alaska accidents from 1990 through 2001. Cause category explanations are listed below, with the abbreviations used in the table in parentheses.

- **Mechanical Failure:** Engine failure, inoperable control surfaces, failed landing gear, propeller or shaft failure.

- **Navigation (CFIT, TCF):** Usually Controlled Flight into Terrain (CFIT) while en route, most often associated with reduced visibility. In the YK Delta, CFIT also occurs in nominal VFR conditions when “flat light” on snow-covered ground prevents recognition of terrain. Terrain Clearance Floor (TCF) warnings are a Terrain Awareness and Warning System (TAWS) function planned for Capstone Phase 2 that addresses the 20%-30% of CFIT accidents on approach or departure. These are not directly addressed by Capstone Phase 1 avionics. Rarely, accidents are due to disorientation, which can be addressed by a GPS-map display.

- **Traffic:** Usually mid-air collisions or near mid-air collisions (NMACs) between aircraft. Also includes accidents from last-moment avoidance of other aircraft and from jet blast on airport surface.

- **Flight Information (Weather, Ice, IMC):** Usually inadequate weather information, especially icing, but also visibility; rarely convective weather. (Surface winds contributing to take-off or landing accidents have been included under take-off or landing rather than here.) Occasionally, lack of information on changes in procedures or facility status.

- **Maneuvering:** Accidents while maneuvering during the cruise phase of flight.

- **Fuel:** Usually fuel exhaustion. Occasionally, failure to switch fuel tanks.

- **Flight Preparation:** Failure to ensure cargo is tied-down and within the aircraft’s weight and balance limits. Failure to check fuel for the presence of water, failure to remove ice or snow from the aircraft – often resulting in serious or fatal accidents.

- **Take-off and Landing:** Failure to maintain control (especially in wind), improper airspeed, or inadequate care near vehicles or obstacles. Accidents due to poor runway conditions, hazards at off-runway sites such as beaches and gravel bars, or from obstacles in water that are struck by float-planes.

- **Other (water taxi):** Includes a variety of unusual causes such as bird strikes, colliding with debris in lakes, rivers and oceans, collisions with ground vehicles and pilots under the influence of alcohol or drugs.

- **Unknown:** Undetermined causes, missing aircraft.

Appendix C. Pilot and Operator Surveys

Survey Summary Methodology
NIOSH Operator Questionnaire
Air Carrier Survey: Capstone questions
NIOSH Pilot Interview, Fall/Winter 2001/02
This page intentionally left blank
C-1. Survey Research Methodology

Objective

We conducted surveys of both pilots and operators in Southeast Alaska. These surveys were part of a larger effort to collect information about qualifications, practices and attitudes of pilots and company management for aviation operators in Alaska. Based on survey responses, focus group results, and consultation with Alaskan aviation safety experts, the National Institutes of Occupational Safety and Health (NIOSH) will develop policy options designed to reduce aviation fatalities.

NIOSH contracted with the Institute of Social and Economic Research (ISER) of the University of Alaska Anchorage to design and administer two statewide aviation safety surveys, one of air carrier managers and one of active commercial pilots. This document describes the methodology for the pilot survey, which addressed pilot demographics, flight hours (total, aircraft type, and instrument hours), Alaska flying experience, attitudes about safety, flying practices, and other salient risk factors.

Instrument Development

Focus Groups

We hypothesized that there were measurable differences in attitudes, policies and behaviors of pilots and operators that put some pilots and operators at greater risk of a crash than others. We further hypothesize that aspects of the economic and/or regulatory environment may be reinforcing those higher-risk characteristics. To investigate these hypotheses, NIOSH conducted focus group meetings between May and November of 2000 among pilots, operators, and villagers in five Alaska regions. Both NIOSH and ISER reviewed the findings of previous Alaska aviation studies. Findings from these two sources became the foundation of the research questions, and core of both the pilot and operator survey questionnaires.

Draft Questionnaires

Respondents were asked to reply to questions about flight practices, attitudes, and perceptions from their personal perspective. The questionnaires covered several areas:

1. Pilot demographics, certifications and flight experience
2. Flight experiences in their current employment relevant to the identified safety issues
3. Training provided by their current employer relevant to the identified safety issues
4. Operator policies and practices
5. Attitudes about those safety issues and about potential ways to address them
6. For operators who may be part of Capstone Phase II, questions about their attitudes about that equipment.

Pre-Test

The questionnaires were pre-tested on six pilots and six companies to filter out confusing questions and terms, confirm that perception and attitude questions worked, and to determine the time required to administer the survey. We also had to deal with sensitivity to questions about practices that are contrary to federal aviation regulations (FARs). In addition to an understandable reluctance to admit to breaking the law, some respondents also raised concerns that their survey responses to such questions would be used for enforcement purposes. For the same reasons, we chose not to ask pilots questions about their employers that might call for explanations of practices or procedures contrary to FARs.

Use of previously collected data

While prior studies examining crashes in commuter and air taxi services have provided useful leads on comparative information and examples of how to conduct this type of research, they do not
provide the specific information needed for the reduction of deaths related to air crashes in Alaska. No existing information, such as that available from the NTSB or FAA accident data reporting systems, has been identified of the type required for these studies. Additionally, appropriate denominators and exposure estimates of commercial pilots are inaccurate and unreliable. Our review of the scientific and technical literature did not yield the number of commercial pilots per year or the number of pilot flight hours or flights per year in Alaska.

**Sample Design**

Both pilots and operators were the units of analysis in this study. The survey population for this study consists of

1. air carrier companies supervised by the FAA’s Juneau Flight Standards District Office (FSDO), as of November 2000, and updated in December, 2002, and

2. pilots who flew for those companies:

**Survey Protocols**

We generated the pilot sample from interviews with the air carrier operators. ISER interviewed operators from August 2001 through February 2002; we interviewed pilots from December 2001 through February 2002. As described above, the universe from which we drew the pilot sample was the pilots employed by operators that we interviewed. In the final section of the large operator/company questionnaire we requested a list of pilots employed by that carrier and their telephone numbers. If the operator provided the list, the interviewer verified that the number of pilots on the list was the same as the number reported in question 1 (pilots currently employed by the carrier). If the numbers were different, the interviewer resolved the inconsistency, either by correcting question 1 or correcting the pilot list, as appropriate. Once the numbers were the same, the interviewer chose a pilot sampling sheet with the same number of pilots as listed. The pilot sampling sheets (generated by an excel spreadsheet) randomly selected which pilots on a numbered list should be interviewed. We generated a new sampling sheet, with different random sample, for each company.

If the operator refused to provide pilot information after follow-up by an interviewer experienced in turning around refusals, we tried one of several options. We preferred option (1) or (2), but used option (3) when that was all the operator would agree to.

1. Work with the operator to obtain contact information only for pilots selected for interview. We would never see the full list of employees. The interviewer would direct the operator to choose names based on where they fell on list. For example, the interviewer, using a sampling sheet, would direct the operator to choose the 3rd, 5th and 8th pilots on the operator’s list. The operator then provided us with names and contact phone numbers for the selected pilots.

2. Obtain a list of pilot names without contact information; draw the sample and mail the questionnaire to the company for delivery to the selected pilots.
3. Work with the operator (as above) so that the operator could select the random sample, but in addition, have the operator distribute the questionnaires to the selected pilots (rather than providing contact information to ISER).

In all cases when ISER mailed questionnaire to pilots we included a self addressed stamped envelope for the pilot to return the questionnaire to ISER. We also provided a form so that the pilot could mail us their telephone number, in which case we would call the pilot directly and conduct the survey over the telephone.

Initially we mailed surveys or called all selected pilots, and followed-up by telephone and fax as necessary. In most cases, we expected interviewers to complete surveys over the telephone. In cases where telephone contact was unsuccessful or where the pilots preferred face to face contact, interviewers arranged to complete the interview in person.

Our methodology incorporated the standard strategies used to obtain high survey response rates. We trained interviewers thoroughly so that they understood the goals of the research, the questionnaire, and the protocols for administering the questionnaire. We followed up by telephone (wherever possible) if we did not receive a response to an initial contact by mail. If necessary, we followed up with face-to-face contact where both telephone and mail contacts were unsuccessful. We did not assign the “unable to contact” disposition to a telephone number until we had made repeated calls on different days of the week and at different times of day. Likewise, we attempted face-to-face contacts on different days of the week and at different times of day. If potential respondents refused the survey, interviewers experienced at turning refusals around called them and attempted to change their minds. This rigorous telephone interview approach minimizes non-response bias at the outset by generating a non-biased sample, and then by ensuring a high response rate.

In addition, we followed up with face-to-face interviews in April, 2002 in order to add several of the operators that we missed in the initial NIOSH survey, and to ask Capstone attitude questions. We interviewed ten operators, three of whom had not been interviewed in the earlier NIOSH survey administration,
Interviewer Training

ISER hired and trained interviewers for telephone and face-to-face, interviews with respondents. The initial training was 16 hours and used the following outline:

Day 1

Research ethics - statement of professional ethics
Confidentiality
History of ISER
Purpose of survey
Background
Purposes and structure of Alaska Aviation Safety Survey
Selecting the respondent
General rules for interviewing
Thumbnail sketch
Style
Introductions
   Special interview circumstances
   Handling reluctant respondents

Some techniques to prevent or turn around a refusal:
Misinterpreted questions
Vague answers and answers that don’t fit
Clarifying respondent’s role using positive feedback
Disposition of interview and record keeping
Evaluation

Day 2

Practice interview
   Disposition of interviews, record keeping
   Paired interviewer practice
   Readiness check —1
   Practice interviews
   Readiness check —2
   Initial sample assignment

Interviewers are evaluated and approved by the field supervisor for readiness prior to their starting telephone interviews

Confidentiality

All respondents received voluntary participation and confidentiality information in a consent form. Participants who responded by mail or face-to-face were given a copy of the form to keep, and also signed a copy that was attached to the interview. If respondents returned a mail for fax survey without a signed consent form, we considered them to have given their implied consent. For telephone respondents, interviewers read the consent form and obtained the respondent’s verbal consent. The form included the following items:

1. The authority and purpose for data collection,
2. an explanation that participation was voluntary,
3. An explanation of the confidentiality of their responses, including assurances that
   • responses would not be used in any enforcement actions ,
• although survey results would be available to the air carrier operator and pilot associations, federal agencies, and other interested parties, this would be in summary format only -- without any personal or corporate identifiers.

• the information provided is kept confidential. Responses are locked in a file cabinet with access limited to research staff on the project

**Events Surrounding the NIOSH Survey**

Respondents were expected to naturally refer to their own experience and prior flying experience in thinking about their responses. Three events occurred during the course of this survey, which are certain to have affected pilot’s responses. On September 11 there were the tragic events at the World Trade Center and the shut-down of aviation nationwide. In response to the uncertainty in the aviation industry and concern among respondents we stopped interviewing for one week. On October 11, there was the worst commercial crash in Alaska since 1987 involving one of the largest regional operators in Alaska. On October 19, there was a helicopter crash in Anchorage involving another of the largest regional carriers. How and to what extent these events may have influenced pilots’ responses is unknown, but a series of events of this magnitude are likely to have affected public attitudes, perceptions, and business practices.

**Survey Dispositions and Response Rates**

Table F-2 shows the response rates for Capstone operators and pilots. Every operator and pilot selected for the NIOSH sample was ultimately assigned a disposition code:

- Refusals
- Respondent Unavailable During the Study
- Completed Interview

The response rate is calculated as:

\[
\text{Response Rate} = \frac{\text{Total # of completed interviews}}{\text{Number in the original sample}}
\]

For purposes of calculating the response rates, we did not include the 61 Capstone pilot modules obtained by Dr Daniels in Bethel and at Capstone training classes.

<table>
<thead>
<tr>
<th></th>
<th>Sample</th>
<th>Completed Interviews</th>
<th>Response Rate*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Southeast Operators*</td>
<td>30</td>
<td>23</td>
<td>76%</td>
</tr>
<tr>
<td>Pilots Employed by Southeast Operators*</td>
<td>37</td>
<td>30</td>
<td>81%</td>
</tr>
</tbody>
</table>

*The true operator response rate is slightly lower; we did not draw an extended sample for our face-to-face interviews in April 2002, but simply added three new operators to the database.

**Data Set**

A data editor reviewed the completed survey forms for completeness and consistency; whenever possible, our interviewers called back respondents to resolve any problems we found. We reconfirmed our data entry programs to reject some types of incorrect data. We entered a sample of the surveys twice and compared the two entries to measure the accuracy of data entry. Once all the survey data was entered, we reviewed it and corrected for missing or unreasonable values.
**Weighting**

We initially calculated normalized weights for operators, using statewide data. We calculated an initial weight by dividing the number of operators in each stratum (large operators, small Southcentral, small North/Interior; small Southeast) by the number of respondents in that stratum. To normalize the weights, we multiplied each initial weight by a fraction computed as the sample size (153) divided by the sum of all the 153 operator weights.

We calculated two sets of weights for the pilot surveys. The first—`pilotwt` and `normalized pilotwt`—weighted sample pilots to represent all pilots flying for the operators whose pilots we interviewed. The second set—`totalwt` and `normalized totalwt`—adjusts the first set of weights to represent all pilots in our universe: pilots employed by air taxi and commuter air operators and public agencies flying in Alaska.

To weight to the operators represented in the survey, we calculated a separate weight for each company

\[
Pilotwt = \frac{\text{Total pilots employed by company}}{\text{Total Pilot Interviews completed from company}}
\]

This formula reflects the fact that the pilot’s probability of selection was different for each company size. We then normalized this weight in the same way as described for the operator weights, so that the weighted total pilots equaled the number of pilot respondents (38):

To adjust the sample to represent all pilots in our universe, we needed to account for the operator’s probability of selection, as well. We multiplied the (non-normalized) pilot weight by the (non-normalized) company weight, and again normalized those weights to represent the total number or pilot respondents.

\[
\text{Totalwt} = \text{Pilotwt} \times \text{Company Weight}
\]

Use of normalized weights is appropriate to accurately calculate statistical significance and confidence intervals from the survey data. Since the pilot sample was stratified by company there is a unique weight for each of the 133 air operators represented in the sample. Consequently, the weights themselves are confidential.

We present the weighted operator and pilot survey responses. However, because the operators responding to the Capstone-specific questions were both purposive (operators that had expressed an interest in participating in the program) and non-random (other operators in the same communities, available when our interviewer was there) we present the answers to those Capstone questions unweighted.

The following pages show the instruments with frequencies (and ranges and means, as appropriate).
As part of expanding its Capstone Program into Southeast Alaska, the FAA had contracted with the University of Alaska to conduct a study of aviation safety in Southeast prior to the Capstone implementation. As part of that study, we are using surveys conducted for the National Institute of Occupational Safety and Health in their 2001-2002 study to improve aviation safety throughout Alaska. This questionnaire was designed for that study; we are asking operators who were not selected in the NIOSH sample to complete the questionnaire.

In addition, we are asking all operators to complete an excerpt from the Capstone Module of that survey, designed to study the first Capstone implementation, in the Yukon-Kuskokwim Delta area.

We want to know your thoughts and perceptions about aviation in Alaska as well as about your actual aviation practices. It will take about xx minutes to complete the questions.

Your answers will be kept confidential and will be used only in combination with those of others so that no company or individual can be identified. Do you have any questions before we begin?
I would like to begin by asking you a few questions about the operation of your air carrier business.

OP1. First, how many pilots do you, including yourself, currently employ? **5.17** (average includes operators asked at different seasons)

OP2. How many pilots, including yourself, do you typically employ each season, during the summer? the autumn? the winter? and the spring?

<table>
<thead>
<tr>
<th>Season</th>
<th>Pilots</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summer</td>

<td>3</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

OP7. Is there some other pilot experience or qualification that is more important than any of the four I just mentioned?

4 No
15 Yes

OP7a. Will you please describe it? Pilot safety history; recommendations; flight evaluation; ability to handle stress and make good decisions; maturity; attitude; personality; formal training

OP8. How much of a problem is pilot fatigue in pilot scheduling? Is it a major problem, a minor problem, or not a problem?

0 A major problem
12 A minor problem
11 Not a problem

OP9. How do you pay your pilots? (USE CHOICES AS PROBE IF NECESSARY)

0 Hourly for all duty hours
0 Hourly for flight hours only
10 Salary
5 Combination of salary and flight hours
0 Combination of flight hours, duty hours, and salary
0 Flight completions
7 Other

OP9a. Please explain Salary plus bonus; self-employed

C-11
**OP10.** Do you pay your pilots overtime?

<table>
<thead>
<tr>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>18</td>
<td>2</td>
</tr>
</tbody>
</table>

**OP10a.** Under what conditions?

- No responses

**OP11.** From your personal experience, are the FARs interpreted consistently by different inspectors at different times?

<table>
<thead>
<tr>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>12</td>
</tr>
</tbody>
</table>

**OP11a.** Interpretation of flight and duty time; interpretation of manuals; maintenance discrepancies; this was more of a problem in the past

**OP12.** Do you feel that some FARs interfere with getting the job done, without contributing to safety?

<table>
<thead>
<tr>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>14</td>
</tr>
</tbody>
</table>

**OP12a.** Which regulations are they and why do you feel that way?

- Hazmat regulations too complex for small carriers; SVFR traffic in Ketchikan; arbitrary AD’s; safer to fly in 300'/20 miles than in 500'/2 miles; items installed for a particular use can’t be removed without removing all associated components (e.g., air conditioning; load manifests for each type of helicopter)

**OP13.** Does your company require higher-than-FAA weather minimums for flying?

<table>
<thead>
<tr>
<th>No</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>11</td>
</tr>
</tbody>
</table>

**OP13a.** When did your company began this requirement?

**OP13b.** Please describe your policy or send/fax a copy (786-7739)

- Higher for flight-seeing; pilots have personal minimums; dispatch similar to part 121 operation

**OP14.** Does your company have one or more written programs for pilot training to help pilots deal with whiteout conditions (with low visibility conditions, flat lighting conditions, recovery from inadvertent flight into IMC?)
Now I'm going to ask about pilot checking procedures for the same four conditions:

OP15. Does your company have one or more written programs for pilot checking to ensure pilot proficiency in whiteout conditions (in low visibility conditions, flat lighting conditions, recovery from inadvertent flight into IMC)?

<table>
<thead>
<tr>
<th>Condition</th>
<th>Yes</th>
<th>No</th>
<th>If yes, when started</th>

</tr>
</tbody>
</table>

OP16. Who, inside or outside the company, has the authority to cancel a flight? (MARK ALL THAT APPLY)

- 23 Pilot
- 18 Someone else in the company

(WHAT IS THEIR POSITION? AND ARE THEY A PILOT?)

Chief Pilot; Director of Operations; Owner; Dispatcher; Base Manager; President; VP; Tour Operations manager

- 8 Someone else outside the company

(WHAT IS THEIR POSITION? AND ARE THEY A PILOT?)

Passengers, FAA

INTERVIEWER CHECKPOINT: IF A NON-PILOT EMPLOYEE MAKES DECISIONS ABOUT LAUNCHING FLIGHTS ASK TO OP17. IF A PILOT EMPLOYEE (PILOT OR CHIEF PILOT, ETC.) SKIP TO OP18

OP17. What initial and recurrent training does the company provide or require that person to have?

No responses.
OP18. Does your company have a written list of required conditions to launch a flight, for example, a risk assessment worksheet?

21 No 2 Yes

OP18a. When did your company begin to use this list?
1 response: draft in spring 2002

OP18b. Please send/fax a copy of this list (786-7739). Not provided

OP19. How many of your aircraft have auto pilots? Do you consider the auto pilot to be very helpful, somewhat helpful, or not at all helpful to flight safety in Alaska (NOT JUST TO YOUR COMPANY)? (CONTINUE WITH THE LIST OF REMAINING EQUIPMENT USING SAME QUESTION FORMAT)

<table>

</tbody>
</table>

OP21. In the last 18 months, has there been a change in your company’s insurance costs per seat?

16 Yes 4 No change ☐

Skip to Question OP 22
OP21a. Did the costs increase or decrease?

13 Increase: from 2 to 300%; mean 91%
3 Decrease from 5 to 10%; mean 8%

OP21aa. By what percent did they increase or decrease?

OP21b. Why do you believe they changed?

Industry increase; accidents; Alaska market; 9/11; women take fewer risks

OP22. What survival equipment, beyond legally required items, is in your company aircraft?

Note that the US Forest Service minimums are required; cell phone; marine radio; survival suits

OP23. What training does your company provide to use the survival equipment in the aircraft?

Annual emergency training; familiarization; joint exercise with Coast Guard and Civil Air patrol; complete, including underwater egress training
OP24. Now, we are interested in your opinion about measures that might improve aviation safety throughout Alaska, not just in your company.

Can you tell me how effective each of the following measures could be in preventing aircraft crashes if it were widely applied in Alaska aviation?

<table>
<thead>
<tr>
<th>Possible measures to use in preventing aircraft crashes</th>

c. Pilot training improvements in white-out/flat-light conditions | 11        | 9         | 2         |
d. Pilot training improvements in regional hazards     | 12        | 9         | 1         |

Now think about company policy and procedures….

Would company policies that included written criteria for go/no go decisions be very effective, somewhat effective, or not effective in preventing aircraft crashes? (CONTINUE THE LIST OF REMAINING MEASURES USING SAME QUESTION FORMAT.)

<table>
<thead>
<tr>
<th>Company policies and procedures</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
e. Written criteria for go/no-go decisions            | 5         | 12        | 5         |
f. Rewards from management for flights or flight hours without accidents/incidents | 8         | 8         | 6         |
g. Pay based on salary rather than flight hours or flights | 12        | 6         | 4         |
h. More flight time required of new pilots            | 9         | 6         | 7         |
i. Better checks of a pilot’s flying history before hiring | 9         | 7         | 6         |

Now think about the weather….

Would more locations with manned weather reporting be very effective, somewhat effective, or not effective in preventing aircraft crashes? (CONTINUE THE LIST OF REMAINING MEASURES USING SAME QUESTION FORMAT.)

<table>
<thead>
<tr>
<th>Weather</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
j. More locations with manned weather reporting       | 15        | 7         | 1         |
k. More locations with automated weather reporting    | 13        | 7         | 2         |
l. Increased accuracy of existing weather reporting    | 14        | 9         | 0         |
m. Increased and improved use of video cameras, such as mountain pass cameras | 20        | 1         | 1         |
n. Improved passenger understanding of weather hazards | 7         | 7         | 8         |
Now think about the operating environments for companies like yours.

Would changes in how by-pass mail is given to operators be very effective, somewhat effective, or not effective in preventing aircraft crashes? (CONTINUE THE LIST OF REMAINING MEASURES USING SAME QUESTION FORMAT.)

<table>
<thead>
<tr>
<th>Operating Environment</th>
<th># of Respondents</th>
</tr>
</thead>
<tbody>
<tr>
<td>o. Changes in how by-pass mail is given to operators</td>
<td>2 6 2</td>
</tr>
<tr>
<td>p. More time to deliver by-pass mail before it’s switched to another operator</td>
<td>3 6 1</td>
</tr>
<tr>
<td>q. Financial incentives (e.g., lower insurance rates, preference in mail contracts) for flights or flight hours without accidents/incidents</td>
<td>6 2 4</td>
</tr>
</tbody>
</table>

OP25. Thinking of the seventeen (17) measures you just rated, if you had to choose only two as most useful, which would they be? (REPEAT MEASURES IF NECESSARY AND RECORD THE APPROPRIATE LETTER IN THE BOX.)

<table>
<thead>
<tr>
<th>Safety Measure from OP 24</th>
<th># of Respondents</th>
</tr>
</thead>
<tbody>
<tr>
<td>b. Pilot training improvements in decision-making</td>
<td>13</td>
</tr>
<tr>
<td>m. Increased and improved use of video cameras, such as mountain pass cameras</td>

</tr>
<tr>
<td>l. Increased accuracy of existing weather reporting</td>
<td>2</td>
</tr>
<tr>
<td>n. Improved passenger understanding of weather hazards</td>
<td>1</td>
</tr>
</tbody>
</table>

OP26. Are there any other measures that we didn't mention that might improve aviation safety in Alaska?

16 Yes 4 No

What are they?

Better avionics (EGPWS and Capstone); Medallion Program participation; For pilots, more experience, better flight training; knowledge (especially local area), and knowledge of maintenance; AWOS weather reporting at non-airport locations; economic re-regulation.
P 27. What other about aviation safety in Alaska do you think we should know about?

<table>
<thead>
<tr>
<th>Considering the variety of activities, the elements, number of operations, and the seasonal nature of the flight peaks suggests that Alaska aviation accidents are surprisingly low. The situational awareness of a moving map display would be the most useful tool in the airplane to reduce accidents.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changes in attitude and education (e.g. risk management) should improve aviation safety, given several years.</td>
</tr>
<tr>
<td>Accidents usually happen here in August/Sept largely due to short season with long hours. Fatigue and 14-hr duty day over a season of 7-day weeks take its toll.</td>
</tr>
<tr>
<td>Good consistent maintenance</td>
</tr>
<tr>
<td>There is a need for thorough flight checkout of pilot applicants--more important than flight hours or history.</td>
</tr>
<tr>
<td>More IFR flight, twin-engine operation could improve flight safety if these were economically feasible.</td>
</tr>
<tr>
<td>(a) Too few career Alaska pilots; (b) VFR flying in Alaska requires more knowledge than IFR flying; (c) accidents correlate with the availability of qualified pilots; (d) the second season is more dangerous than for new pilots.</td>
</tr>
</tbody>
</table>
Air Carrier Survey: Capstone questions
Capstone Phase II Baseline Study
Southeast Alaska

The Alaskan Region’s "Capstone Program" is an accelerated effort to improve aviation safety and efficiency through installation of government-furnished Global Positioning System (GPS)-based avionics and data link communications suites in commercial aircraft. Capstone was originally implemented in the Yukon-Kuskokwim Delta area of Alaska; the Phase II implementation area is Southeast Alaska.

The following questions are about how you expect the Capstone program to affect your operations in Southeast Alaska. You may not know the answers to some questions – that’s fine. We are interested in finding out what Southeast Alaska air carriers know about the program, and what they expect it to do, as of March 2003, before it’s been fully implemented.

Thanks you for answering!

</tbody>
</table>
CO9. Are there other benefits the Capstone program will provide?

Situational awareness; support in emergency such as inadvertent IMC; improved operations in marginal VFR; oversight by company dispatch; newer pilots will be lost less; reduced insurance rates; improved safety confidence; increased pilot comfort; more accurate and timely decisions; lower Minimum Enroute Altitudes (e.g. for medivac patients who need lower altitude; to avoid icing); improved passenger confidence.

Please rank the top three potential benefits to you from Capstone, and explain why:

<table>
<thead>
<tr>

<td>1</td>
<td>7</td>
<td>3</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
CO11. Are there other potential problems for you that Capstone may cause or add to?

Using equipment to push the weather; attempting to use it to fly into IFR; lack of redundancy if used for IFR; pilots may not talk to each other; attitude differences between older, experienced and younger, less experienced pilots; 75 percent of time flying over salt water; if used to fly very low would be dangerous; overconfidence; danger of over reliance on Capstone; maintenance difficulties in salt water environment; less experienced pilots using equipment to fly in unfamiliar terrain; minimum equipment lists (grounded if Capstone is not working); training costs for proficiency; maintenance costs after FAA program ends.

CO15. Which of the issues below do you think might cause pilots to choose not to use Capstone equipment?

<table>
<thead>
<tr>
<th></th>
<th>Yes</th>
<th>No</th>
<th>Don’t Know/ No Opinion</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Too distracting</td>

COfinal. What other concerns do you have about the Capstone program or about aviation safety in SE Alaska?

- Capstone can help new pilots in their learning of the areas and its unique characteristics, which is now a concern.
- Traffic avoidance with transient aircraft that are not Capstone equipped
- It’s not a level playing field with regard to federal excise taxes.
- Concerns about Special VFR regulations, especially in Ketchikan.
- The benefit will come if everyone has Capstone, not just a few.
- Remember we’re still a VFR environment; pilots could get lazy and spend too much time inside.
- Company and pilot attitudes towards safety is a concern, as is the weather.
- Capstone program appears to be designed for IFR operations; most operators in SE Alaska are not IFR certified.
- In heavily trafficked areas, the aircraft avoidance feature could be too distracting, in addition to the problem of not all aircraft being equipped.
- There are many open questions concerning design of Capstone avionics and operation in VFR helicopter operations.
I would like to begin by asking you a few questions about your flying career and your background.

A1. Which pilot ratings and certificates do you hold?

- 36 Commercial
- 27 Instrument
- 17 ATP
- 10 Helicopter
- 13 Flight instructor
- 31 Single-engine land
- 18 Multi-engine land
- 24 Single-engine sea
- 10 Multi-engine sea
- 3 Others (please specify)

CFII; glider tow (3)

A2. How many total hours have you flown in Alaska? how many in the last 12 months? Now can you tell us how many Alaska departures have you made in your total flight career? In the last 12 months? Finally, can you tell us how many total hours you have flown in all locations, including Alaska? how many in the last 12 months?

Mean Hours reported:

<table>
<thead>
<tr>
<th>Flight Hours</th>
<th>Alaska</th>
<th>All Locations, incl. Alaska</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Flight Career</td>
<td>5304</td>
<td>7212</td>
</tr>
<tr>
<td>Last 12 months</td>
<td>239</td>
<td>591</td>
</tr>
</tbody>
</table>

The next questions ask about your total flight career.

A3. How many instrument hours have you flown in Alaska? ➔ Mean: 119 hrs

A3a. Can you estimate your total number of instrument hours? ➔ Mean: 305 hrs

A4. How many hours have you flown for your current employer? ➔ Mean: 2376 hrs

---

1 Data are weighted and rounded to whole numbers; totals may be slightly different than 36 unweighted responses
A5. Thinking about the number of years you have flown in Alaska, how many have been seasonal?

1.2 Years range: 0 to 6 years

A5a. How many have been year-round?

7.8 Years range: 0 to 36 years

A6. Please estimate what percent of your paid flight hours in 2000 occurred in each season. (For example, 100% summer; or 25% spring, 50% summer, 25% autumn, etc.)

<table>
<thead>
<tr>
<th>Season</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spring</td>
<td>15%</td>
</tr>
<tr>
<td>Autumn</td>
<td>20%</td>
</tr>
<tr>
<td>Summer</td>
<td>54%</td>
</tr>
<tr>
<td>Winter</td>
<td>11%</td>
</tr>
</tbody>
</table>

A7. Over your entire career, how many different companies have you worked for as a pilot?

4 range: 1 to 12

A7a. Over how many years has that been?

13.8 yrs range: 1 to 39

A8. What is your gender?

2 Female
34 Male

A9. What is your race? (multiple responses allowed)

1 American Indian or Alaska Native
36 White
1 Latino

A10. What is the highest level of formal education you have completed? (PLEASE MARK ONLY ONE)

<table>
<thead>
<tr>
<th>Education Level</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attended high school; didn’t graduate</td>
<td>9</td>
</tr>
<tr>
<td>GED</td>
<td>11</td>
</tr>
<tr>
<td>High school diploma</td>
<td>0</td>
</tr>
<tr>
<td>Attended college; no degree</td>
<td>2</td>
</tr>
<tr>
<td>Associate’s degree</td>
<td>1</td>
</tr>
<tr>
<td>Bachelor’s degree</td>
<td>12</td>
</tr>
<tr>
<td>Master’s degree</td>
<td>0</td>
</tr>
<tr>
<td>Doctoral degree</td>
<td>0</td>
</tr>
</tbody>
</table>
A11. Now, based on your experience as a pilot, do you feel that some Federal Aviation Regulations interfere with getting the job done, without contributing to safety?

17 No 18 Yes

A11a. Can you give me one or more examples?

<table>
<thead>
<tr>
<th>135 - 100, no talking unless straight/level flight below 10,000 ft. Regs on flight + duty time are confusing so it doesn't help toward safety</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowing a 14-hr duty day instead of something less, like 10-12- hr duty days. Far Part 135.</td>
</tr>
<tr>
<td>The duty time and time off max duty day of 14 hours with only 13 days off required in 90 days</td>
</tr>
<tr>
<td>Power struggle between pilots and FAA especially if pilots are more experienced. Anchorage FAA inspectors came to Juneau demanded main struts be pumped down 3 1/2 “ from 7 “, it created tail dragging and prop damage</td>
</tr>
<tr>
<td>FAA does just what it wants to do and interprets all the regs the way they see fit, even if basic safety is at stake.</td>
</tr>
<tr>
<td>Flight duty time under 135 is in direct conflict with the ability to perform, some pilots can work 10hours straight and others can’t handle 6 hours, part 67 covers physical condition and mental ability, leave it to part 67</td>
</tr>
<tr>
<td>Southeast AK seaplane operators used to be able to fly at lower altitudes with greater visibility, that has been eliminated, law requires you to be at 500 feet now, it was safer flying at lower altitudes</td>
</tr>
<tr>
<td>Weather minimums to a point, the letter of the law does interfere with safe flight operations, but I know there’s got to be stipulations</td>
</tr>
<tr>
<td>Carrying weapons is a hot topic. Sept 11th would have been less of a tragedy if FAA had allowed cockpit crews to be armed</td>
</tr>
<tr>
<td>Processes involved in certifying particular maintenance procedures, we’re trying to get approval for ski basket for the helicopter. We’re being denied using it without scientific proof that we’re not going to crash the aircraft, which costs millions of dollars</td>
</tr>
<tr>
<td>Seat removal legs, cloud clearance requirements</td>
</tr>
<tr>
<td>Seat removal and replacement re: small single engine aircraft</td>
</tr>
</tbody>
</table>

A12. Are there routes, locations, or conditions that should require higher than FAA minimum weather conditions for flying?

22 No 8 Yes

A12a. What are they?

A13. During the peak season, what hours do you typically work each day, including periods of time you are not on duty?

Mean hours worked: 12; range from 8 to 14 per day

A14. During the peak season, how many hours per day are you typically on duty?

Duty hours per day: mean 12 hrs

A15. During the peak season, how many days per week do you typically work?

Days per week: mean 5.4 Range; 5 to 7

Calculated hours per week: mean 66 hours; range 30 to 98 hours per week
A16. During the peak season, how often would you have liked to decline a flight due to fatigue, but you flew anyway? (MARK ONLY ONE)

<table>

</tr>
</tbody>
</table>

range of comments:

- Execute a 180 degree turn and/or descend and maintain visual contact with land
- Personal procedures, company procedures are not standard
- Contact base
- Return to VMC immediately
- If bad weather fly close to shore so if we hit bad weather we can turn to land, do a 180 and drop down as low as we need
- Get out of it; change altitude
- Change altitude
- Get out of it; change altitude; radio base.
- We are taught slow the aircraft, 180 degree turn, transfer to instrument flight, return to VFR conditions. Training involves recognition and avoidance. I don't believe in inadvertent, you make a decision

A23. Has your employer provided you with training and/or check rides to help you deal with white-out conditions?

<table>
<thead>
<tr>
<th></th>
<th>Training &amp; Check Rides</th>
<th>Training</th>

A27. If you refuse to launch a flight due to marginal weather, how likely is it that your passengers will fly with a different company? Is it not at all likely, somewhat likely, or very likely?

<table>
<thead>
<tr>
<th>Question</th>
<th>Not at all likely</th>
<th>Somewhat likely</th>
<th>Very likely</th>
<th>Don't know</th>
<th>Not applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Your passengers will fly with a different company?</td>
<td>18</td>
<td>10</td>
<td>7</td>
<td>0</td>
<td>2</td>
</tr>
<tr>
<td>b. The Post Office will give bypass mail to another company?</td>
<td>5</td>
<td>1</td>
<td>3</td>
<td>8</td>
<td>19</td>

</tr>
</tbody>
</table>

A29. Do you have any accidents or incidents on your record?

<table>
<thead>
<tr>
<th>No or Yes</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>No</td>
<td>30</td>
</tr>
<tr>
<td>Yes</td>
<td>4</td>
</tr>
</tbody>
</table>
A30. Now I'm going to read some different types of avionics, and I would like you to tell me how helpful you think each is in preventing crashes? How helpful is the auto pilot? Is it very helpful, somewhat helpful, or not helpful? (MARK ONE ANSWER FOR EACH)

<table>
<thead>
<tr>
<th></th>
<th>Very Helpful</th>
<th>Somewhat Helpful</th>
<th>Not Helpful</th>
<th>Don't know</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Auto pilot</td>
<td>9</td>
<td>10</td>
<td>11</td>
<td>2</td>
</tr>
<tr>
<td>b. VOR</td>
<td>3</td>
<td>19</td>
<td>13</td>
<td>1</td>
</tr>
<tr>
<td>c. GPS – VFR</td>
<td>33</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>d. GPS – IFR</td>
<td>14</td>
<td>11</td>
<td>6</td>
<td>2</td>
</tr>
<tr>
<td>e. Loran</td>
<td>1</td>
<td>6</td>
<td>22</td>

<td>17</td>
<td>3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A31. I would like to ask your opinion about measures that might improve aviation safety for all pilots in Alaska.

Can you tell me how effective pilot training improvements in meteorology could be in preventing aircraft crashes if widely applied in Alaska aviation? Would it be very effective, somewhat effective, or not effective?

<table>
<thead>
<tr>
<th>Possible measures to use in preventing aircraft crashes</th>
<th>Very Effective</th>
<th>Somewhat Effective</th>
<th>Not Effective</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pilot training improvements in the following areas:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a. Pilot training improvements in meteorology</td>
<td>19</td>
<td>11</td>
<td>5</td>
</tr>
<tr>
<td>b. Pilot training improvements in decision-making</td>
<td>28</td>
<td>6</td>
<td>3</td>
</tr>
<tr>
<td>c. Pilot training improvements in white-out/flat-light conditions</td>
<td>19</td>
<td>15</td>
<td>2</td>
</tr>
<tr>
<td>d. Pilot training improvements in regional hazards</td>
<td>24</td>
<td>10</td>
<td>2</td>
</tr>
</tbody>
</table>
Now I'm going to ask about company policy and procedures, would company policies that included **written criteria for go/no go decisions** be very effective, somewhat effective, or not effective in preventing aircraft crashes?

<table>
<thead>
<tr>
<th>Possible measures to use in preventing aircraft crashes</th>
<th>Very Effective</th>
<th>Somewhat Effective</th>
<th>Not Effective</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Company policies and procedures</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>e. Written criteria for go/no-go decisions</td>
<td>10</td>
<td>17</td>
<td>9</td>
</tr>
<tr>
<td>f. Rewards from management for flights or flight hours without accidents/incidents</td>
<td>12</td>
<td>14</td>
<td>9</td>
</tr>
<tr>
<td>g. Pay based on salary rather than flight hours or flights</td>
<td>18</td>
<td>16</td>
<td>2</td>
</tr>
<tr>
<td>h. More flight time required of new pilots</td>
<td>17</td>
<td>13</td>
<td>6</td>
</tr>
<tr>
<td>i. Better checks of a pilot’s flying history before hiring</td>
<td>8</td>
<td>21</td>
<td>8</td>
</tr>
</tbody>
</table>

Now thinking about the weather, would more locations with **manned** weather reporting be very effective, somewhat effective, or not effective in preventing aircraft crashes?

<table>
<thead>
<tr>
<th>Weather</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>j. More locations with manned weather reporting</td>
<td>25</td>
<td>9</td>
<td>2</td>
</tr>
<tr>
<td>k. More locations with automated weather reporting</td>
<td>20</td>
<td>13</td>
<td>4</td>
</tr>
<tr>
<td>l. Increased accuracy of existing weather reporting</td>
<td>21</td>
<td>14</td>
<td>1</td>
</tr>
<tr>
<td>m. Increased and improved use of video cameras, such as mountain pass cameras</td>
<td>24</td>
<td>8</td>
<td>4</td>
</tr>
<tr>
<td>n. Improved passenger understanding of weather hazards</td>
<td>6</td>
<td>14</td>
<td>17</td>
</tr>
</tbody>
</table>

I’ll move on now to operating environments for companies like yours. Would changes in **how by-pass mail is given to operators** be very effective, somewhat effective, or not effective in preventing aircraft crashes?

<table>
<thead>
<tr>
<th>Operating Environment</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>o. Changes in how by-pass mail is given to operators</td>
<td>2</td>
<td>6</td>
<td>22</td>
</tr>
<tr>
<td>p. More time to deliver by-pass mail before it’s switched to another operator</td>
<td>3</td>
<td>7</td>
<td>18</td>
</tr>
<tr>
<td>q. Financial incentives (e.g., lower insurance rates, preference in mail contracts) for flights or flight hours without accidents/incidents</td>
<td>10</td>
<td>17</td>
<td>8</td>
</tr>
</tbody>
</table>
A32. Thinking of those 17 measures you just rated, if you had to choose only two as most useful, which would they be?

<table>
<thead>
<tr>
<th>Measures listed</th>
<th>Number of ‘votes’</th>
</tr>
</thead>
<tbody>
<tr>
<td>b. Pilot training improvements in decision-making</td>
<td>19</td>
</tr>
<tr>
<td>j. More locations with manned weather reporting</td>
<td>12</td>
</tr>
<tr>
<td>q. Financial incentives (e.g., lower insurance rates, preference in mail contracts) for flights or flight hours without accidents/incidents</td>
<td>8</td>
</tr>
<tr>
<td>a. Pilot training improvements in meteorology</td>
<td>5</td>
</tr>
<tr>
<td>g. Pay based on salary rather than flight hours or flights</td>
<td>5</td>
</tr>
<tr>
<td>h. More flight time required of new pilots</td>
<td>5</td>
</tr>
<tr>
<td>m. Increased and improved use of video cameras, such as mountain pass cameras</td>
<td>4</td>
</tr>
<tr>
<td>d. Pilot training improvements in regional hazards</td>
<td>3</td>
</tr>
<tr>
<td>l. Increased accuracy of existing weather reporting</td>
<td>3</td>
</tr>
<tr>
<td>c. Pilot training improvements in white-out/flat-light conditions</td>
<td>2</td>
</tr>
<tr>
<td>k. More locations with automated weather reporting</td>
<td>2</td>
</tr>
<tr>
<td>f. Rewards from management for flights or flight hours</td>
<td>1</td>
</tr>
<tr>
<td>p. More time to deliver by-pass mail before it’s switched to another operator</td>
<td>1</td>
</tr>
</tbody>
</table>

A33. If there are other measures that you believe might improve aviation safety in Alaska, but which we didn't discuss in the previous question, can you tell me what they are?

Better equipment for IFR operations, i.e. radar services, better assistance to evaluate and tailor IFR approaches for 135/121 operations. In Southeast AK, support floatplane operations, approved VFR corridors to fly lower than 500 feet with 2 miles vis.

Change the State aviations culture to one of quality air service with zero compromises instead of getting the job done. Ensure that FAA supports these operators and punishes the cowboys.

AWOS/ASOS would be a great addition to your ability to disseminate weather very fast updates once/minute.

Recurrent pilot training every six months instead of twelve for FAR 135 operators.

More AWOS stations in villages; Putting automated wx observation units in certain areas and/or passes I think might enhance safety.

We need more manned weather stations. 90% of accidents are weather-related.

High cost of insurance and mandatory FAA regulations cause 135’s to push weather to make enough to pay for all this. I think high operations cost is the reason we have so many accidents in AK.

If Capstone is proving to be so great, why isn’t it being considered for all of Alaska?

There are too many private pilots flying that don’t know what they are doing.

More on-site human observers. AWOS/ASOS are inadequate. NWS computer modeling depends on accurate and plentiful observations. AWOS/ASOS are not dependable or accurate. We used to have plentiful observation stations in the 1960s and 70s, what happened?

More local flight service, the present system is far from what we use to have. Less of this automated junk and some personnel in the field doing the job.

Need to lower altitude and increase visibility, safer system for our jobs.

We would like to see Capstone expanded to our area, Yakutat.

Capstone project or some of the aspects of the Capstone project, terrain avoidance and aircraft traffic avoidance would benefit us.

Periodic training through the year for new pilots to interact also with seasoned pilots.

FAA is too nosey and not consistent in dealing with aviation problems. They watch us so closely for the least thing and don’t realize we are human beings just like them.

More AWOS stations in the smaller communities.

Most companies are great, but some companies put pressure on pilots to perform and that can lead to accidents. Also, reduce amount of paperwork that is required; that will take stress off a pilot. Also, how about an occasional “slap on the back” for good.

We need to install more AWOS throughout Alaska.

We need more seasoned pilots who know how to fly and use common sense. Where are our older pilots?

More consistency in the FAA. Every inspector they have seems to have a different interpretation of the regulations. They need to focus on safety more and paperwork less.

Smaller communities need to get traffic advisories directly rather than going through other larger communities flight services.

Pilots need to fly within their equipment and experience capabilities.

More manned weather stations would be helpful.
A34. Do you have any other comments you would like to add about aviation safety in Alaska?

<table>
<thead>
<tr>
<th>Challenging task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Over the 24 years I've been doing this, been a lot of changes all good toward safety. I'm very encouraged to the extent that safety's taken in this state mostly d/t operators. Also FAA + pilots; nature of our business is turnover.</td>
</tr>
<tr>
<td>Don't really have any, there will always be pilots out there who will make bad decisions, it's hard to make rules and regulations that will stop them from making bad decisions.</td>
</tr>
<tr>
<td>Aircraft accidents can never be totally eliminated. Both pilot decision making and aircraft will continue to breakdown. Fast moving weather will also catch pilots off-guard. But, through pilot training and improved weather information distribution, both</td>
</tr>
<tr>
<td>Less duty time for pilots.</td>
</tr>
<tr>
<td>Weather reporting has gone down since Flight Service Stations have been shut down.</td>
</tr>
<tr>
<td>A group came into Juneau to study aviation safety last year and found those carriers with the best safety records were the carriers who did annual (hands on) training with their pilots every year.</td>
</tr>
<tr>
<td>Sometimes people tend to fly at night VFR, with single engine. I'd like to see that eliminated.</td>
</tr>
<tr>
<td>The FAA isn't as strict with NEW pilot licensing as they should be. They don't do as thorough check rides as they should before issuing a pilot's license.</td>
</tr>
<tr>
<td>The more experience a pilot has in type of aircraft he flies and the more air time in location where he flies, the less likely he is to have an accident.</td>
</tr>
<tr>
<td>1. Why is it that in the continental U.S., lodges and guides are not allowed to haul clients for pay and yet in AK they are? Lodge and guide operations constitute a large portion of the aviation activity in AK, but are basically unregulated, why?</td>
</tr>
<tr>
<td>We work in a very tough environment, train us and tell us to do the best we can, don't implement more rules, they just confuse the issues at hand</td>
</tr>
<tr>
<td>The duty time requirement is too high, would prefer twelve hrs to current fourteen hrs per day. The company puts pressure on pilots to fly for recognizable financial reasons. This requires the pilot to remain level needed in decision making regarding pa</td>
</tr>
<tr>
<td>One of the most dangerous things I felt when I was fairly new at this game, if weather was questionable, they waited 10 minutes then sent an experienced guy out, this put pressure on new guys and is a big factor in safety</td>
</tr>
<tr>
<td>I think it's inherently pretty safe right now. Of course there are risks. I don't think more regulations will help other than inhibiting operations</td>
</tr>
<tr>
<td>State needs to consider some kind of subsidy for insurance for owner/operators. Getting out of hand. Makes for less flights for residents, insurance rates are prohibitive and I understand its o/t accidents.</td>
</tr>
<tr>
<td>IFR traffic can tie up approach zone to Yakutat, and we have to circle sometime for 20 min.</td>
</tr>
<tr>
<td>It's gotten a bad rap, small operators have been hit pretty hard by insurance companies because of bad press</td>
</tr>
<tr>
<td>If every air carrier trained like Temsco, there would be fewer accidents. They are very caring and helpful and are very strict about maintenance on their aircraft.</td>
</tr>
<tr>
<td>New pilots (inexperienced) need more time in the area they are flying in and the aircraft they are using. After a few trips, it's easy to get &quot;cocky&quot; and not pay attention. They think they've learned it all because they've flown the route a few times.</td>
</tr>
<tr>
<td>We need more public awareness; esp. with this new Capstone, and funding may come in to help the &quot;little guy.&quot;</td>
</tr>
<tr>
<td>Some pilots that fly in bush areas sometimes get bad because there's no one really monitoring the flight. They take too many chances, I understand Capstone (company) can monitor these pilots. If so, we need Capstone in all areas.</td>
</tr>
<tr>
<td>Aeronautical Decision Program that FAA recommends needs to be mandatory. It is excellent for pilots of all experiences.</td>
</tr>
<tr>
<td>Weather is a big factor, and pilots shouldn't be pressured to fly if they don't feel comfortable.</td>
</tr>
<tr>
<td>Pilots and operators in AK spend too much time dealing with the FAA on issues that don't help safety</td>
</tr>
<tr>
<td>The RCO feeds most information to Sitka flight service rather than feeding it directly to Petersburg or any traffic advisories. Petersburg needs to be able to receive traffic advisories directly. We have to get our info directly</td>
</tr>
</tbody>
